How to Select and Size

Select the pump size according to the capacity requirement of the application from the inlet, back pressure and filling head conditions given in the table below.

Back pressure (h) = [H X 0.1 bar g] + FP bar g+LP bar g
where H=height to which condensate is to be lifted in mtrs.
FP= Frictional pressure drop of discharge
LP=Line Pressure

Capacity kg/hr.

When installed with recommended filling head above top of pump :- 305 mm. For liquid specific gravity (0.9 to 1)

1.04	1.06	1.08	1.10	1.12	1.15	1.18	1.23	1.28

Example

Condensate load	1600 kg/hr.
Steam/air pressure available for operating pump	5.0 bar g
Vertical lift from pump to return piping	9 m
Pressure in return piping (piping friction negligible)	1.72 bar g
Filling head on pump	0.3048 mtrs.

Solution

1 Calculate "h", the total lift or back pressure against which the condensate must be pumped.
= (9mx 0.1) + 1.72 = 2.62 bar g

2 From capacity table with 5.0 bar g operating inlet pressure and 3.0 bar g back pressure choose a DN 40 pump which has a capacity of 2290 kg/hr.

Note from Capacity Factor Charts

A Pump capacity if filling head is 0.610 mtr.
= 1.2 x 2290 = 2748 kg/hr.
